Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1323912-1325831, 1471368-1472903 and 1492104-149325). Subtraction by Bento Soares and M.

(destroyed): RNA source leukocytes from anonymous pool of (destroyed); RNA source leukocytes from anonymous pool of non-activated adult donors. Library is oligo-dT primed and directionally cloned (EcoRv Site is destroyed upon cloning). Average insert size 1.7 kb, insert size range 1.2-3.3 kb. Library is normalized and enriched for full-length clones and was constructed by C. Gruber (Invitrogen). Research Genetics tracking code 027. Note: this is a NIH-MCC Library."

Anote-Togan: pooled lung and spleen; Vector: pCMV-SPORT6, Anote-Togan: pooled lung and spleen; Vector: pCMV-SPORT6, Site_1: NotI; Site_2: EcoRV (destroyed); RNA source anonymous pool of 24 week female lung, 16 week female anonymous pool of 24 week female lung, 16 week female spleen. Library is oligo-dT primed and directionally cloned (EcoRV site is destroyed upon cloning). Average insert size 1.4 kb, insert size upon cloning). Average insert size 1.4 kb, insert size full-length clones and was constructed by C. Gruber (Invitrogen). Research Genetics tracking code 026. Note:

Chote—"Vector: p7773D-Pac (Pharmacia) with a modified Polylinker; 1st strand cDNA was prepared from 3 pooled Polylinker; 1st strand cDNA was prepared from 3 pooled germ cell tumors, and was then primed with a Not I oligod(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified p7773 bento Soares and M. Fatima Bonaldo. "

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Description

Isolated polypeptides useful for treating anti-inflammatory diseases, nervous system disorders, and for regenerating bone and cartilage -Claim 1; Page 748-749; 894pp; English. Tang YT, Liu C, Drmanac RT; WPI; 2001-451939/48. P-PSDB; AAU14525.

The invention relates to polynucleotides encoding novel human cative domains. The polypeptides, polynucleotides and treatment of a mammal and prevention of disorders caused by the aberrant conclusive adainst the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant conclusive adapth markers, food supplements, and in antibody production. Polypeptides are used to identify compounds which bind to the primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or carget drugs to a tumour, in assays to determine biological activity, to carget drugs to a tumour, in assays to determine quantitative contact antibodies/alicit an immune response, to determine quantitative cortacten levels, as tissue markers, and to isolate receptors or ligands. Colypeptides of the invention may also be useful in treating platelet contraceptive, treating osteoporosis and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthritis, anammia, the proliferation of farenting osteoporosis and osteoarthritis, anammia, contraceptive, treating osteoporosis and osteoarthritis, anammia, contaction or from autoimmunity, cancer, allergy, asthma, viral or graft-versus-host disease, eczeme, allergy asthma, allergy asthma. graft-versus-host disease, eczema, haemophilia, thrombosis, anti-inflammatory diseases, nervous system disorders, and infection. The present sequence encodes a protein of the invention.

The present sequence is a CDNA encoding human receptor-associated protein (HRAP) from Incyte clone 1361202 obtained from LUNGNOT12 CDNA library. This sequence is expressed in haematopoietle/Lyfmunne, gastrointestinal and reproductive tissues. HRAP has cytostatic, immunomodulatory, antiinflammatory, cardiant, antiarteriosclerotic, hepatotropic, antianterior, antiantendic, antianaemic, antianaemic, antianaemic, antianaemic, antianaemic, artistlergic, dermaclogical and neuroprotective activities. The present sequence is useful in the diagnosis, treatment and prevention of disorders associated with HRAP expression, especially cell proliferative, autoimmune/inflammatory, reproductive, cardiovascular and gastrointestinal disorders (e.g. atherosclerosis, cirrhosis, leukaemia, cancer, AIDS, arthritis, allergies, anaemia, asthma, dermatitis, diabetes, osteoporosis, multiple sclerosis and

```

The present invention relates to the isolation of novel cDNA sequences which encode human secreted proteins. The CDNA sequences have been carlied from a variety of human tissues. The invention also provides to method for producing proteins from these polynucleotide sequences. The proteins are useful for identifying compounds that modulate expression of the polynucleotide sequences. Compounds that modulate expression of the polynucleotide sequences compounds the secreted proteins. The sequences of the invention are useful for treating diseases such as hyperproliferative disorders concern; immuno deficiency disorders (e.g. severe combined concern), immuno disorders (e.g. severe combined concern), immuno disorders (e.g. multiple concern), and disorders (e.g. thrombocytopaenia), inflammatory controlleotide sequences of the invention are also useful in gene increase. ö 339 ACTGACCTTTGGATCTGGGACACAATTGACTGTTTTACCTGATATCCAGAACCCTGACCC 398 371 actcgcttttgggaaggggaaccaagtggtggtcataccaaatatccagaaccctgaccc 430 459 TTTTGATTCTCAAACAAATGTGTCACAAAGTAAGGATTCTGATGTGTATATCACAGACAA 518 519 AACTGTGGTAGACATGAGGTCTATGGACTTCAAGAGCAACAGTGGTGGGCTGGGAGCAA 578 551 aactgigctagacaigaggictaiggacticaagagcaacagigcigiggcciggagcaa 610 0; Gaps 579 CAAAICTGACTIIGCAIGIGCAAACGCCTICAACAACAGCAITAIICCAGAAGACACTI 638 Query Match 72.5%; Score 972.6; DB 24; Length 1386; Best Local Similarity 98.1%; Pred. Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

AAN60079;

```
AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic proteins and can be used in gene therapy and vaccine production. (I) treatment of diseases associated with inappropriate (I) expression. For expension, they may be used to treat disorders associated with decreased that affect the actifying mutations or deletions in a patient's genome supplement the patients own production of (I). Additionally, (I) polynuclectides may be used to produce the secreted (I), by inserting protein. (I) proteins and polynuclectides may be used to produce the secreted (I), by inserting protein. (I) proteins and polynuclectides may be used to prevent, and dispense and treat immune/haematopoietic-related diseases, especially
                                                                                                                                                                                                                                                                                                                                                                                                                       cancers and cancer metastases of haematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention.

AAN60079 was generated from the Jurkat human leukaemia T cell line. It is contained in T cell clone pY14. The labelled nucleic acid and monocLonal or polyclonal antibodies to the polypeptides may be used to determine whether unknown cells, e.g. tumour cells, are T cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence encoding a polypeptide which is at least part of the alpha chain of T cell antigen receptor.

The invention relates to isolated prostate-specific polypeptides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen presenting cells expressing the cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding of cancer especially prostate cancer. The polypeptides, polynucleotides and concer especially prostate cancer. Compositions comprising the development polynucleotide and/or polypeptide are useful for stimulating and/or expanding of cancer capecially prostate cancer. Compositions comprising the development response, and for treating cancer. The oligonucleotide is useful for response, and for treating cancer. The oligonucleotide is useful for molecule raised against a prostate specific polypeptide of the invention.

The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), and can be used in vaccine proteins comprising (II), and isolated can expected using (I) or (II) are used treat cancer in a patient. The cancer that is alignosed or treated is particularly patient. The cancer that is adagnosed or treated is particularly compressed for monitoring the progression of cancer in a patient. (I) and (II) can be used in vaccines. The antibodies or prostate cancer. They can indicate the level of metastasis compethods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH93944 and AAM0115 to exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5

The invention relates to isolated lung tumour-specific proteins and their corresponding cDNA molecules. Lung tumour-specific proteins and their antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting useful for stimulating an immune response, and for treating cancer. The lung tumour specific oligonicleotide is useful in gene therapy and for lung tumour specific oligonicleotide is useful in gene therapy and for lung tumour specific oligonicleotide is useful in gene therapy and for six a cDNA encoding human lung tumour-specific T cell receptor alpha

                                                                                                                                                                                                                                                      constant region. The protein is an immunosupressant which is not antigen-specific and suppresses both humoral and cell -mediated immune reactions. It can be used for treatment and/or prevention of delayed hypersensitivity reactions, allergies and autoimmune reactions, and inhibition of transplant rejection. The protein does not induce the formation of antibodies against them to any significant extent.

```

The invention relates to polynucleotides encoding novel human control or their active domains. The polypeptides, polynucleotides and proteins or their active domains. The polypeptides, polynucleotides are used in a method of content of a mammal and prevention of disorders caused by the aberrant content of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as conjugated and primers, for sequencing, for dentify compounds which bind to the primers, for sequencing, for chromosome or gene mapping, in the primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or production of recombinant proteins, and in generating anti-sense DNA or production of recombinant proteins, and in generating anti-sense DNA or carget drugs to a tumour, in assays to determine biological activity, to target drugs to a tumour, in assays to determine pological activity, to target drugs of the invention may also be useful in treating platelet colypeptides of the invention may also be useful intreating platelet or polypeptides of the invention and survival of stem cell disorders, regenerating boune, cartilage, tendon, disomers, treating osteoprosis and osteoarthritis, an anemia, contraceptive, treating osteoprosis and osteoarthritis, anemia, alternation, the munical manner of scherosis, stroke, immune deficiencies resulting from bacterial, viral or contraceptive, incomer, alseases, amplication, thromosis. Isolated polypeptides useful for treating anti-inflammatory diseases, nervous system disorders, and for regenerating bone and cartilage -Claim 1; Page 220-221; 894pp; English. This sequence represents the coding region for a fusion protein comprising a T-cell receptor (TCR) alpha chain linked to a c-jun leucine zipper motif. The TCR gene is taken from chone JM22 and is targeted to zipper motif. The TCR gene is taken from chone JM22 and is targeted to a synthetic multivalent complex for binding to a major to a synthetic multivalent complex for binding to a major the multivalent complex (MRC) Peptide complexs. The multivalent TCR histocompatibility complex (MRC) Peptide complexes and delivery of therapeutic agents to target cells, in vivo. The specificity of the of therapeutic agents to target cells, in vivo. The specificity of the TCRs enables the localization of the liposome-contained drugs to the desired target site such as a tumour or virus-infected cell. This would be useful in many situations and in particular against tumours because not all cells in the tumour present antigens and therefore are not all Sequence 744 BP; 223 A; 182 C; 174 G; 165 T; 0 other; detected by the immune system.

This sequence represents the coding region for a fusion protein comprising a T-cell receptor (TCR) alpha chain linked to a c-jun leucine in the paper motif. The TCR gene is taken from clone JM22 and is targeted to capture and the paper motif. The TCR gene is taken from clone JM22 and is targeted to an HLA-A2 influenza virus matrix protein epitope. The sequence also the protein in E. coll. The invention relates to a synthetic multivalent complex for binding to a major histocompatibility complex (MHC)-peptide complex for binding to a major histocompatibility complex (MHC)-peptide complexes and delivery of therapeutic agents to target cells, in vivo. The specificity of the TCRs enables the localization of the CV in vivo. The specificity of the TCRs enables the localization of the virus-infected cell. This would be useful in many situations and in contigens and therefore are not all detected by the immune system.
                                                                                                                                                                                                                                                                                                                                                                                                       Fusion protein; T-cell receptor; c-jun; leucine zipper motif; tumour; ss; influenza virus matrix protein epitope; major histocompatibility complex;
